

## CONVERGENCE OF HOMOGENEOUS MATRIX-VALUED $\Lambda$ -MARTINGALES

**Tibor Tórnács (Eger, Hungary)**

**Abstract.** I. Fazekas in [3] studied the classical martingale convergence theorem of Doob for one-parameter  $\Lambda$ -martingales. The theme of this paper is similar but for two-parameters homogeneous  $\Lambda$ -martingales.

### 1. Preliminary result

Let  $(\Omega, \mathcal{F}, P)$  be a probability space in which  $(\xi_i: i = 1, 2, \dots)$  is a sequence of random variables. Let  $(\mathcal{F}_i: i = 1, 2, \dots)$  be a sequence of  $\sigma$ -subalgebras of  $\mathcal{F}$ . We call the process  $(\xi_i, \mathcal{F}_i)$   $i = 1, 2, \dots$  a linear martingale if  $\xi_i$  are  $\mathcal{F}_i$ -measurable and integrable for every  $i = 1, 2, \dots$  furthermore

$$\mathbb{E}(\xi_i \mid \mathcal{F}_{i-1}) = a_1(i)\xi_{i-1} + \dots + a_m(i)\xi_{i-m}$$

for every  $i > m$  integers where  $m$  is a fixed integer. This process satisfies equation  $\mathbb{E}(X_t \mid \mathcal{F}_{t-1}) = \Lambda(t)X_{t-1}$  for every  $t \geq m$  where

$$X_t = \begin{pmatrix} \xi_t \\ \vdots \\ \xi_{t-m+1} \end{pmatrix} \quad \text{and} \quad \Lambda(t) = \begin{pmatrix} a_1(t) & \dots & a_m(t) \\ 1 & & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots \\ 0 & & 1 & 0 \end{pmatrix}.$$

Generalized we call an  $m$ -dimensional process  $(X_t, \mathcal{F}_t)$   $t = 1, 2, \dots$   $\Lambda$ -martingale if  $X_t$  integrable,  $\Lambda(t)$  are given non-random matrices for every  $t$  positive integers and  $\mathbb{E}(X_t \mid \mathcal{F}_{t-1}) = \Lambda(t)X_{t-1}$  ( $t = 1, 2, \dots$ ). If  $\Lambda(t)$  does not depend on  $t$  then  $X_t$  is called a homogeneous martingale. Let  $\Delta_t = X_t - \Lambda(t)X_{t-1}$ ,  $A(s, s) = I$  the identity matrix and

$$A(t, s) = \Lambda(t)A(t-1, s)$$

for every  $t > s$  furthermore we assume that the limit  $A(s) = \lim_{t \rightarrow \infty} A(t, s)$  exists

for every  $s = 1, 2, \dots$ . Let  $Y_t = \sum_{s=1}^t A(s)\Delta_s$  which is called the accompanying martingale of  $X_t$ . I. Fazekas proved in [3] the following theorem:

If  $\|A(t, s) - A(s)\| \leq c_{t-s}$  ( $t \geq s$ ),  $\sum_{n=0}^{\infty} c_n < \infty$ , there exists a positive function  $f(\omega)$  for which  $f(\omega)\|\Delta_s(\omega)\| \leq \|A(s)\Delta_s(\omega)\|$  for every  $s \geq 1$  and  $\omega \in \Omega$  and

$\sup_t \mathbb{E} \|X_t\| < \infty$  then  $\lim_{t \rightarrow \infty} X_t = X_\infty$  almost surely. ( $\|\cdot\|$  denotes the norm of matrix.) In this paper this result is extended to two-parameter version.

## 2. Main result

Let  $\mathbb{N}$  denote the set of positive integers and let  $m$  be a fixed positive integer. Let  $(\Omega, \mathcal{F}, P)$  be a probability space in which  $(\xi_{ij}: i, j \in \mathbb{N})$  is a sequence of real-valued random variables. Let  $(\mathcal{F}_{ij}: i, j \in \mathbb{N})$  be a sequence of  $\sigma$ -subalgebras of  $\mathcal{F}$  which satisfies the so-called condition (F4) introduced by Cairoli and Walsh [2]:

$$\mathbb{E}(\xi | \mathcal{F}_{ij}) = \mathbb{E}(\mathbb{E}(\xi | \mathcal{F}_{i\infty}) | \mathcal{F}_{\infty j}) = \mathbb{E}(\mathbb{E}(\xi | \mathcal{F}_{\infty j}) | \mathcal{F}_{i\infty}), \quad (\text{F4})$$

for every  $i, j \in \mathbb{N}$  where  $\mathcal{F}_{i\infty} = \sigma\{\mathcal{F}_{ij}: j \in \mathbb{N}\}$  and  $\mathcal{F}_{\infty j} = \sigma\{\mathcal{F}_{ij}: i \in \mathbb{N}\}$  ( $\sigma\{\cdot\}$  means generated  $\sigma$ -algebra).

In order to study a convergence property of  $\xi_{ij}$  we introduce the following matrix:

$$X_{ij} = \begin{pmatrix} \xi_{i,j-m+1} & \cdots & \xi_{i,j} \\ \vdots & \ddots & \vdots \\ \xi_{i-m+1,j-m+1} & \cdots & \xi_{i-m+1,j} \end{pmatrix}$$

**Definition 1.** Let  $\Lambda_{kl}$  be given non-random real matrices (their types are  $m \times m$ ). Suppose that  $\Lambda_{0,0} = I$  (the identity matrix),

$$\Lambda_{ij} \Lambda_{kl} = \Lambda_{i+k,j+l} \quad \forall i, j, k, l \in \mathbb{N} \cup \{0\} \quad (1)$$

$X_{ij}$  is  $\mathcal{F}_{ij}$ -measurable and integrable for every  $i, j \in \mathbb{N}$ . If

$$\mathbb{E}(X_{i+k,j+l} | \mathcal{F}_{ij}) = \Lambda_{kl} X_{ij}$$

for every  $k, l \in \mathbb{N} \cup \{0\}$  and  $i, j > m$  integers then the process  $(X_{ij}, \mathcal{F}_{ij})$   $i, j \in \mathbb{N}$  is called a homogeneous matrix-valued  $\Lambda$ -martingale.

Let us introduce the martingale difference

$$\begin{aligned} \Delta_{ij} &= X_{ij} - \mathbb{E}(X_{i,j} | \mathcal{F}_{i-1,j}) - \mathbb{E}(X_{i,j} | \mathcal{F}_{i,j-1}) + \mathbb{E}(X_{i,j} | \mathcal{F}_{i-1,j-1}) \\ &= X_{ij} - \Lambda_{1,0} X_{i-1,j} - \Lambda_{0,1} X_{i,j-1} + \Lambda_{1,1} X_{i-1,j-1} \end{aligned}$$

for  $i, j > 1$  integers,  $\Delta_{1,1} = X_{1,1}$ ,  $\Delta_{i,1} = X_{i,1} - \Lambda_{1,0} X_{i-1,1}$  for  $i > 1$  integers and  $\Delta_{1,j} = X_{1,j} - \Lambda_{0,1} X_{1,j-1}$  for  $j > 1$  integers.

**Lemma 1.** *With the previous notations and conditions  $X_{ij} = \sum_{k=1}^i \sum_{l=1}^j \Lambda_{i-k,j-l} \Delta_{k,l}$  for every  $i, j \in \mathbb{N}$ .*

**Proof.** Using (1) we have this lemma by induction.

**Definition 2.** We assume that  $\Lambda_{kl}$  is convergent and  $\Lambda = \lim_{\substack{k \rightarrow \infty \\ l \rightarrow \infty}} \Lambda_{kl}$ . Then

$$Y_{ij} = \sum_{k=1}^i \sum_{l=1}^j \Lambda \Delta_{k,l}$$

is called the accompanying martingale of  $X_{ij}$ .

**Lemma 2.** If  $f: \mathbb{R}^+ \rightarrow \mathbb{R}^+$  is a convex non-decreasing function and

$$\sup_{i,j} \mathbb{E}f(\|X_{ij}\|) < c < \infty$$

then  $\sup_{i,j} \mathbb{E}f(\|Y_{ij}\|) < c$  as well. (In this paper  $\|\cdot\|$  denotes the norm of a matrix.)

**Proof.** Let  $r, s$  be fixed integers,  $1 \leq i \leq r$ ,  $1 \leq j \leq s$  and

$$Y_{ij}^{(rs)} = \sum_{k=1}^i \sum_{l=1}^j \Lambda_{r-k, s-l} \Delta_{k,l}.$$

Then it is easy to see that  $(f(\|Y_{ij}^{(rs)}\|), \mathcal{F}_{ij})$   $1 \leq i \leq r$ ,  $1 \leq j \leq s$  is a real submartingale, so we get by Lemma 1

$$\mathbb{E}f(\|Y_{ij}^{(rs)}\|) \leq \mathbb{E}f(\|Y_{rs}^{(rs)}\|) = \mathbb{E}f(\|X_{rs}\|) < c$$

for every  $1 \leq i \leq r$ ,  $1 \leq j \leq s$  integers. On the other hand  $\lim_{\substack{r \rightarrow \infty \\ s \rightarrow \infty}} Y_{ij}^{(rs)} = Y_{ij}$  thus by Fatou's lemma we have Lemma 2.

**Theorem.** Let the process  $(X_{ij}, \mathcal{F}_{ij})$   $i, j \in \mathbb{N}$  is a homogeneous matrix-valued  $\Lambda$ -martingale which is satisfies (F4). Let us suppose that  $\Lambda_{kl}$  is convergent,  $\Lambda = \lim_{\substack{k \rightarrow \infty \\ l \rightarrow \infty}} \Lambda_{kl}$  and there exist constants  $c_{kl}$  such that

$$\|\Lambda_{kl} - \Lambda\| < c_{kl} \quad \text{and} \quad \sum_{k=1}^{\infty} \sum_{l=1}^{\infty} c_{kl} < \infty \quad (2)$$

for every  $k, l \in \mathbb{N}$ . If

$$\|\Delta_{kl}\| \leq q^{k+l} \quad (3)$$

for every  $k, l \in \mathbb{N}$  where  $0 < q < 1$  is a fixed real number and

$$\sup_{k,l} \mathbb{E} \left( \|X_{kl}\| \log^+(\|X_{kl}\|) \right) < \infty \quad (4)$$

then  $X_{ij}$  converges almost surely.

**Proof.** We get by Lemma 1 and (2)

$$\begin{aligned} \|X_{ij} - Y_{ij}\| &= \left\| \sum_{k=1}^i \sum_{l=1}^j (\Lambda_{i-k, j-l} \Delta_{kl} - \Lambda \Delta_{kl}) \right\| \leq \\ &\leq \sum_{k=1}^i \sum_{l=1}^j \|\Lambda_{i-k, j-l} - \Lambda\| \cdot \|\Delta_{kl}\| \leq \sum_{k=1}^i \sum_{l=1}^j c_{i-k, j-l} \|\Delta_{kl}\|. \end{aligned}$$

Let  $r = i - k$  and  $s = j - l$  thus we have by (3)

$$\begin{aligned} \|X_{ij} - Y_{ij}\| &= \sum_{r=0}^{i-1} \sum_{s=0}^{j-1} c_{rs} \|\Delta_{i-r, j-s}\| \leq \sum_{r=0}^{i-1} \sum_{s=0}^{j-1} c_{rs} q^{i-r+j-s} = \\ &= \frac{1}{q^{-(i+j)}} \sum_{r=0}^{i-1} \sum_{s=0}^{j-1} c_{rs} q^{-(r+s)} \end{aligned}$$

So we get by Kronecker's lemma (see it for example [4]) that  $\lim_{\substack{i \rightarrow \infty \\ j \rightarrow \infty}} \|X_{ij} - Y_{ij}\| = 0$ .

By (4), Lemma 2 and Cairoli's theorem (see in [1]) there exists  $\lim_{\substack{i \rightarrow \infty \\ j \rightarrow \infty}} Y_{ij}$  thus the

Theorem is proved.
